

Everett Duwell King - Senior Full Stack Engineer

everett516duwell@outlook.com | +1 945 254 4757 | Paramount, CA | <https://www.linkedin.com/in/everett-king-9661610>

SUMMARY

Seasoned Full-Stack Software Engineer with **11+ years of professional experience** designing, developing, and deploying scalable web applications, cloud-native backend systems, and AI-powered solutions. Specialized in **Python, TypeScript, React, and FastAPI**, with extensive experience building **LLM-powered applications, Retrieval-Augmented Generation (RAG)** systems, autonomous AI agents, and production-ready enterprise software. Proven expertise in designing high-performance APIs, distributed systems, real-time applications, and intelligent automation workflows for compliance-sensitive and mission-critical environments. Strong background in software architecture, database optimization, DevOps, cloud infrastructure, and modern AI frameworks, with a passion for building reliable, secure, and maintainable software.

SKILLS

- **Languages & Frameworks:** Python, TypeScript, React, FastAPI, Node.js, Next.js, Django, Express.js, Java, C#
- **AI & LLM Tooling:** LangChain, LangGraph, LlamaIndex, OpenAI, Anthropic, vLLM, TGI
- **RAG & Vector Stores:** embeddings, pgvector, Qdrant, FAISS, retrieval and reranking strategies
- **Backend:** async/await, SQLAlchemy, Pydantic, REST/OpenAPI, SSE/WebSocket, background job orchestration, GraphQL,
- **Frontend:** React hooks, state management (TanStack Query, Zustand, Redux Toolkit), streaming UI patterns, AI chat interfaces, frontend performance optimization
- **Data & Databases:** PostgreSQL, schema design, indexes, migrations, transactions
- **Observability & Testing:** logging, metrics, model evals, token/cost monitoring, unit/integration/eval tests
- **DevOps & Collaboration:** Git, CI/CD, code review, packaging, deployment practices for regulated environments

PROFESSIONAL EXPERIENCE

Codal - Senior Full Stack Engineer (9/2024 – 4/2026)

- Led end-to-end delivery of agentic AI features for an enterprise client operating under export control and SOX constraints, coordinating with platform, product, and data teams to meet compliance requirements.
- Designed and implemented multi-step agent workflows using LangChain and LangGraph, including tool/function calling, memory layers, and human-in-the-loop checkpoints to ensure safe decision points.
- Built Python FastAPI services exposing AI capabilities with streaming endpoints (SSE/WebSocket) and structured function-calling APIs for frontend consumption.
- Implemented background orchestration for long-running agent runs using async job workers and reliable retry logic to maintain stability in production workflows.
- Developed RAG pipelines: document chunking, embedding generation, vector storage (pgvector, Qdrant), and retrieval/reranking strategies tuned for enterprise document sets.
- Integrated multiple model providers behind abstraction layers, enabling runtime switching between OpenAI, Anthropic, and on-prem open-source models (vLLM/TGI) with contextual awareness of latency and cost.
- Built React/TypeScript UI components for streaming chat, tool-rendering, and document workflows that handled partial state updates and incremental rendering.

- Owned eval and observability for AI features: prompt/response logging with PII handling policies, model performance tracking, token and cost monitoring, and regression evaluation suites for prompt stability.
- Implemented OpenAPI-driven API design, versioning, and error contracts to support downstream integrators in a regulated environment.
- Ensured schema design and transactional integrity for metadata and audit trails, working closely with DBAs on indexes and migrations.
- Wrote integration and eval tests for agent workflows, including synthetic scenario runners and regression checks to detect model behavior drift.
- Participated in security and compliance reviews, translating controls into engineering requirements and remediations for deployment pipelines.
- Mentored engineers on best practices for building LLM-backed services in production, including prompt engineering hygiene and observability patterns.
- Conducted code reviews and established standards for packaging Python services for enterprise deployment and maintenance.

Paralect - Senior Software Engineer (12/2021 – 7/2024)

- Owned backend services for a multi-tenant SaaS product, designing APIs and data models focused on secure tenant isolation and role-based access control.
- Implemented service endpoints in Python with async processing and SQLAlchemy-managed PostgreSQL schemas to support transactional workflows.
- Led a migration to OpenAPI-first API design and improved API documentation and versioning practices for internal and partner consumption.
- Built integration points for document ingestion and search, introducing embeddings and vector search prototypes to augment product search capabilities.
- Collaborated with frontend teams to create React/TypeScript components for interactive dashboards and forms that gracefully handled streaming and partial updates.
- Improved observability across services by adding structured logging, traces, and alerting for business-critical flows.
- Designed database indexes and query plans for complex reporting endpoints to improve stability under concurrent tenant load.
- Implemented automated tests and CI pipelines to ensure reliable deployments and regression protection for customer-facing features.
- Coordinated with product and QA to define acceptance criteria and rollout strategies for new features, including staged rollouts and feature flags.
- Provided mentorship and code review feedback to raise engineering standards around API design and error handling.
- Evaluated third-party AI and vector tools for integration feasibility and compliance posture within a customer-focused SaaS offering.

Saritasa - Software Engineer (3/2019 – 10/2021)

- Developed full-stack features for custom client applications across healthcare and professional services domains, emphasizing data privacy and secure integrations.
- Implemented RESTful APIs and backend services in Python and Node.js, handling authentication, file processing, and integrations with client systems.
- Built React frontends with TypeScript, focusing on responsive interfaces, state management, and accessibility improvements for client portals.

- Delivered document processing pipelines including OCR preprocessing, text normalization, and indexing to support search and retrieval scenarios.
- Prototyped retrieval strategies using embeddings and experimented with FAISS for client proof-of-concept search features.
- Improved unit and integration test coverage, introducing automated pipelines for build and deployment to staging environments.
- Collaborated with client stakeholders to translate domain requirements into technical specifications and measurable acceptance tests.
- Tuned database queries and implemented pagination and caching strategies to improve response times for heavy list and export operations.
- Participated in cross-team code reviews and knowledge sharing sessions to align on architecture and reusable components.
- Assisted in onboarding junior engineers and establishing coding standards across multiple project teams.

Elinfochips - Software Engineer (11/2014 – 1/2019)

- Worked on embedded and IoT-related projects, implementing firmware-adjacent services and cloud connectors for device telemetry ingestion and processing.
- Designed and implemented telemetry ingestion pipelines that normalized device messages and fed downstream analytics systems.
- Built backend services for device management, provisioning, and OTA workflows, with attention to reliability over intermittent network connections.
- Implemented data schemas and storage strategies for time-series and metadata in PostgreSQL and NoSQL stores.
- Integrated message queues and background processing for bulk device operations and event-driven workflows.
- Collaborated with hardware and QA teams to define integration tests and diagnostics for field-deployed devices.
- Created dashboards and admin tools for device fleet monitoring and troubleshooting, using frontend frameworks for interactive UIs.
- Optimized data serialization and transport to reduce latency and improve throughput for constrained devices.
- Contributed to documentation and runbooks for deployment and operational support of IoT services.
- Engaged with cross-functional teams to align on security requirements and secure device onboarding processes.

EDUCATION

Bachelor of Science in Information Technology, The University of Phoenix (5/2010 – 9/2014)
